June/2019 Braindump2go AZ-400 Exam Dumps with PDF and VCE New Updated Today! Following are some new AZ-400 Real Exam Questions:**1.|2019 Latest AZ-400 Exam Dumps (PDF & VCE) Instant Download:** https://www.braindump2go.com/az-400.html**2.|2019 Latest AZ-400 Exam Questions & Answers Instant Download:** https://drive.google.com/drive/folders/1kLhX5N_Pt_noAKZD50xUpnSEA5Tt62TZ?usp=sharingCase Study 1 - Litware (QUESTION 1 - QUESTION 5)OverviewExisting EnvironmentLitware, Inc. e an independent software vendor (ISV) Litware has a main office and five branch offices.Application ArchitectureThe company's primary application is a single monolithic retirement fund management system based on ASP.NET web forms that use logic written in VB.NET. Some new sections of the application are written in C#.Variations of the application are created for individual customers. Currently, there are more than 80 live code branches in the application's code base.The application was developed by using Microsoft Visual Studio. Source code is stored in Team Foundation Server (TFS) in the main office. The branch offices access the source code by using TFS proxy servers.Architectural IssuesLitware focuses on writing new code for customers. No resources are provided to refactor or remove existing code. Changes to the code base take a long time, as dependencies are not obvious to individual developers.Merge operations of the code often take months and involve many developers. Code merging frequently introduces bugs that are difficult to locate and resolve.Customers report that ownership costs of the retirement fund management system increase continually. The need to merge unrelated code makes even minor code changes expensive.Customers report that bug reporting is overly complex.Planned changesLitware plans to develop a new suite of applications for investment planning. The investment planning applications will require only minor integration with the existing retirement fund management system.The investment planning applications suite will include one multi-tier web application and two iOS mobile application. One mobile application will be used by employees; the other will be used by customers.Litware plans to move to a more agile development methodology. Shared code will be extracted into a series of packages.Litware has started an internal cloud transformation process and plans to use cloud-based services whenever suitable. Litware wants to become proactive in detecting failures, rather than always waiting for customer bug reports.Technical requirements The company's investment planning applications suite must meet the following requirements: New incoming connections through the firewall must be minimized. Members of a group named Developers must be able to install packages. The principle of least privilege must be used for all permission assignments. A branching strategy that supports developing new functionality in isolation must be used. Members of a group named Team Leaders must be able to create new packages and edit the permissions of package feeds. Visual Studio App Center must be used to centralize the reporting of mobile application crashes and device types in use. By default, all releases must remain available for 30 days, except for production releases, which must be kept for 60 days. Code quality and release quality are critical. During release, deployments must not proceed between stages if any active bugs are logged against the release. The mobile applications must be able to call the share pricing service of the existing retirement fund management system. Until the system is upgraded, the service will only support basic authentication over HTTPS. The required operating system configuration for the test servers changes weekly. Azure Automation State Configuration must be used to ensure that the operating system on each test server is configured the same way when the servers are created and checked periodically.Current Technical Issue The test servers are configured correctly when first deployed, but they experience configuration drift over time. Azure Automation State Configuration fails to correct the configurations.Azure Automation State Configuration nodes are registered by using the following command. QUESTION 1To resolve the current technical issue, what should you do to the Register-AzureRmAutomationDscNode command?A. Change the value of the ConfigurationMode parameter.B. Replace the Register-AzureRmAutomationDscNode cmdlet with Register-AzureRmAutomationScheduledRunbookC. Add the AllowModuleOverwrite parameter.D. Add the DefaultProfile parameter.Answer: AExplanation:Change the ConfigurationMode parameter from ApplyOnly to ApplyAndAutocorrect. The Register-AzureRmAutomationDscNode cmdlet registers an Azure virtual machine as an APS Desired State Configuration (DSC) node in an Azure Automation account.Scenario: Current Technical IssueThe test servers are configured correctly when first deployed, but they experience configuration drift over time. Azure Automation State Configuration fails to correct the configurations. Azure Automation State Configuration nodes are registered by using the following command. References:
https://docs.microsoft.com/en-us/powershell/module/azurerm.automation/register-azurermautomationdscnode?view=azurermps-6.13.0QUESTION 2What should you use to implement the code quality restriction on the release pipeline for the investment planning applications suite?A. a triggerB. a pre deployment approvalC. a post-deployment approvalD. a deployment gateAnswer: BExplanation:When a release is created from a release pipeline that defines approvals, the deployment stops at each point where approval is required until the specified approver grants approval or rejects the release (or re-assigns the approval to

another user).Scenario: Code quality and release quality are critical. During release, deployments must not proceed between stages if any active bugs are logged against the release.References:
https://docs.microsoft.com/en-us/azure/devops/pipelines/release/approvals/approvalsQUESTION 3Hotspot QuestionHow should you complete the code to initialize App Center in the mobile application? To answer, select the appropriate options in the answer area.NOTE: Each correct selection a worth one point. Answer: Explanation:Scenario: Visual Studio App Center must be used to centralize the reporting of mobile application crashes and device types in use.In order to use App Center, you need to opt in to the service(s) that you want to use, meaning by default no services are started and you will have to explicitly call each of them when starting the SDK. Insert the following line to start the SDK in your app's AppDelegate class in the didFinishLaunchingWithOptions method.MSAppCenter.start("{Your App Secret}", withServices: [MSAnalytics.self, MSCrashes.self]) References:**https://docs.microsoft.com/en-us/appcenter/sdk/getting-started/ios**QUESTION 4Hotspot Question How should you configure the release retention policy for the investment planning applications suite? To answer, select the appropriate options in the answer area.NOTE: Each correct selection is worth one point. Answer: Explanation:Scenario: By default, all releases must remain available for 30 days, except for production releases, which must be kept for 60 days.Box 1: Set the default retention policy to 30 daysThe Global default retention policy sets the default retention values for all the build pipelines. Authors of build pipelines can override these values.Box 2: Set the stage retention policy to 60 daysYou may want to retain more releases that have been deployed to specific stages.References:**https://docs.microsoft.com/en-us/azure/devops/pipelines/policies/retention**
QUESTION 5Hotspot QuestionYou need to configure a cloud service to store the secrets required by the mobile applications to call the share.What should you include in the solution? To answer, select the appropriate options m the answer area. NOTE: Each correct selection is worth one point. Answer: Explanation:Every request made against a storage service must be authorized, unless the request is for a blob or container resource that has been made available for public or signed access. One option for authorizing a request is by using Shared Key.Scenario: The mobile applications must be able to call the share pricing service of the existing retirement fund management system. Until the system is upgraded, the service will only support basic authentication over HTTPS. The investment planning applications suite will include one multi-tier web application and two iOS mobile application. One mobile application will be used by employees; the other will be used by customers.References:
