Drag and Drop Question You are designing a database for a university. The database will contain two tables named Classes and StudentGrades that have the following specifications:- Classes will store brochures in the XPS format. The brochures must be structured in folders and must be accessible by using UNC paths.- StudentGrades must be backed up on a separate schedule than the rest of the database. You need to identify which SQL Server technology meets the specifications of each table. Which technologies should you identify? To answer, drag the appropriate technology to the correct table in the answer area. Answer: QUESTION 117 You use SQL Server 2014 to maintain the data used by applications at your company. You want to execute two statements. You need to guarantee that either both statements succeed, or both statements fail together as a batch. Which code should you use? A. Option AB. Option BC. Option CD. Option DE. Option E

Answer: D Explanation: Structure should be: BEGIN TRY BEGIN TRANSACTION.. COMMIT TRANSACTION END TRY BEGIN CATCH ROLLBACK TRANSACTION END CATCH. QUESTION 118 Your company has a SQL Azure subscription. You implement a database named Database1. Database1 has two tables named Table1 and Table2. You create a stored procedure named sp1. Sp1 reads data from Table1 and inserts data into Table2. A user named User1 informs you that he is unable to run sp1. You verify that User1 has the SELECT permission on Table1 and Table2. You need to ensure that User1 can run sp1. The solution must minimize the number of permissions assigned to User1. What should you do? A. Grant User1 the INSERT permission on Table2. B. Add User1 to the db_datawriter role. C. Change sp1 to run as the sa user. D. Grant User1 the EXECUTE permission on sp1. Answer: D

Explanation: http://msdn.microsoft.com/en-us/library/ms191291.aspx QUESTION 119 You deploy a SQL Server instance named SQLProd that uses SQL Server 2014. You need to recommend a solution to monitor the transactions that are running currently against SQLProd. The solution must minimize the amount of custom code required. What should you recommend? A. Statistics B. A dynamic management view C. A trigger D. User-defined views

Answer: B Explanation: Dynamic management views and functions return server state information that can be used to monitor the health of a server instance, diagnose problems, and tune performance. Transactions can be monitored. QUESTION 120 Your network contains an Active Directory domain that has two groups named Group1 and Group2. The domain contains two SQL Server instances named SQLDev and SQLProd. Each SQL Server instance has access to various storage media. The SQL Server instances have a database that contains a table named Table1. Table1 contains a column named Column1. The value for Column1 can be either Value1 or Value2. You need to recommend a solution to ensure that users in Group1 can retrieve only rows from Column1 that contain the value of Value1. What should you recommend? A. A dynamic management view B. Filegroups C. Snapshot isolation D. User-defined views

Answer: D Explanation: A view is a virtual table whose contents are defined by a query. Like a table, a view consists of a set of named columns and rows of data. Unless indexed, a view does not exist as a stored set of data values in a database. The rows and columns of data come from tables referenced in the query defining the view and are produced dynamically when the view is referenced. A view acts as a filter on the underlying tables referenced in the view. Incorrect: Not A: Dynamic management views and functions return server state information that can be used to monitor the health of a server instance, diagnose problems, and tune performance. QUESTION 121 You are the new database administrator for a SQL Server 2014 instance. You conduct an assessment on the instance and determine that the auto create statistics setting on the database named DB1 has been turned off. You see no evidence that any maintenance has been occurring. You want to set up monitoring to see if query performance is being affected. You need to set up a monitoring process that will capture any cases where statistics could have been useful if they existed. What should you do? A. Create a SQL Server Agent job to execute DBCC SHOWSTATISTICS on each of the primary key columns in the database. B. Use the missing_column_statistics extended event. C. Query the sys.statistics system view to see all cases where the statistics were last needed. D. Write a query using the sys.dm_db_missing_index_group_stats DMV

Joining to sys.indexes, filtering on is_hypothetical. Answer: B Explanation: The Missing Column Statistics event class indicates that column statistics that could have been useful for the optimizer are not available. By monitoring the Missing Column Statistics event class, you can determine if there are statistics missing for a column used by a query. This can cause the optimizer to choose a less efficient query plan than expected. QUESTION 122 You have two databases named DB1 and DB2 that are located on the same server. You plan to create a stored procedure named SProc1 in DB1. SProc1 will query a table named Table2 in DB2. You need to recommend a solution to ensure that SProc1 can access Table2 without granting users direct access to Table2. What should you include in the
