A. It issues certificates encountered on the Untrust security zone when clients attempt to connect to a site that has be decrypted/B. It is used when web servers request a client certificate.C. It is presented to clients when the server they are connecting to is signed by a certificate authority that is not trusted by firewall.D. It is used for Captive Portal to identify unknown users. Answer: CExplanation:Though a single certificate can be used for both Forward Trust and Forward Untrust, creating a separate certificate specifically for Untrust (which must be generated as a CA) allows for easy differentiation of a valid certificate/trust error as the Palo Alto Networks device proxies the secure session. Verify the CA to be blocked, keeping in mind that doing so blocks access to all sites issued by this CA.
